CONCLUSION: Disarticulation of the hip remains a disabling procedure usually carried out for high grade sarcomas with extensive involvement of bone and soft tissues in the thigh. Long term survival is possible if wide margins of excision can be achieved.

Outcome after disarticulation of the hip for sarcomas.

Soft tissue sarcomas may be treated with limb-sparing procedures in the majority of cases; however, certain cases involving significant tumor spread and fungation may call for amputation. In the thigh, hip disarticulation typically involves a pedicled gluteus maximus flap or a pedicled anterior quadriceps flap.

THE SUKGTAL TECHNIQUE FOR HINDQUARTER AMPUTATION

The sarcoma has much less chance of coming back after surgery if it's removed with clear margins. In this case, surgery may be the only treatment needed. When the tumor is in the abdomen, it can be hard to remove it and enough normal tissue to get clear margins because the tumor could be next to vital organs that can't be taken out.
