In newborns, controlled and auxiliary artificial lung ventilation is carried out exclusively by pressure-controlled ventilators that switch over time, with a continuous flow of gas in the respiratory circuit. These devices can easily compensate for gas leaks in the breathing circuit, which usually occur in ventilation in young children.

Artificial ventilation of the lungs - I Live! OK
clinical practice, and provides adequate pulmonary ventilation With minimal adjustments, once attached to a source of gas (directly or through[a machine) and to the patient's airway. It causes little/or no distraction from the immediate attention to the patient, and requires practically no maintenance.

The takaoka respirator for automatic ventilation of the lungs
Mechanical ventilators are machines that act as bellows to move air in and out of your lungs. Your doctor can set the ventilator to control how often it puts air into your lungs and how much air you get. You may be fitted with a mask or helmet to get air from the ventilator into your lungs.

Ventilator/Ventilator Support | NHLBI, NIH
The two main types of mechanical ventilation include positive pressure ventilation where air (or another gas mix) is pushed into the lungs through the airways, and negative pressure ventilation where air is usually, in essence, sucked into the lungs by stimulating movement of the chest.
