Python Solutions to Bayesian computation with Stan and Farmer Jöns. Now, this exercise would surely have been better if I'd used real data, but unfortunately I couldn't find enough datasets related to cows... Finally, here is a depiction of farmer Jöns and his two lazy siblings by the great master Hokusai.

There is unfortunately a limit to the time and to the efforts we can put in this solution manual and studying Bayesian Essentials with R does require some prerequisites in maths (such as matrix algebra and Riemann integrals), and in probability theory (such as the use of joint and conditional densities), as well as some bases of statistics (such as the notions of inference, sufficiency, and confidence sets) that we cannot usefully summarise here.

Amazon is currently making the first edition of Bayesian Computation with R (Use R) by Jim Albert available for free on Kindle. I own a copy of the book and there is a lot of good content and R examples on how one can do general Bayesian statistics. The R scripts from the book (2nd edition but there's a lot of overlap) can be obtained on Jim Albert's web site <http://bayes.bgsu.edu/bcwr/>.

1. Propose new for (t) from $q(j \text{ old} = (t-1))$. 2. Compute the ratio $r = \frac{p(\text{new})q(\text{old} | j)}{p(\text{old})q(\text{new} | \text{old})}$. 3. If $r \geq 1$, set $(t) = \text{new}$; if $r < 1$, set $(t) = \hat{\text{new}}$ with probability r and old with probability $1-r$. Then a draw (t) converges in distribution to a draw from the true posterior density $p(j)$.

To perform the Bayesian computation, we use integrated nested Laplacian approximation (INLA), a highly accurate and computationally efficient alternative to Markov chain Monte Carlo. To identify regions of activation, we propose a novel joint posterior probability map (PPM) method, which eliminates the problem of multiple comparisons .
