Biology Of Disease

Biology of Disease describes the biology of many of the human disorders and disease that are encountered in a clinical setting. It is designed for first and second year students in biomedical science programs and will also be a highly effective reference for health science professionals as well as being valuable to students beginning medical school.

The second edition of The Biology Of Disease is an introductory level text on the biological principles of human disease. The book is aimed at medical students and students on degree courses in bio-medical science. The book fuses the biological (physiological and biochemical) processes, which underlie the clinical manifestation of disease.

Biology of Disease Biology of Disease studies disease mechanisms via internships in pre-clinical and clinical research in medical, biomedical, biological, industrial and veterinary labs. The programme starts with Introducing Life Sciences, a mandatory introduction week for all Master's students of the GSLS. Two tracks are offered:

Biology of Disease | Study Guide

In simple terms a disease can be defined as a disorder of structure or function of an organism that is not a direct result of physical injury. The manifestation of disease is a direct consequence of a disruption of function of a biological system at a molecular and cellular level.

Biology of Disease positions you at the cutting edge of basic and clinical science, in particular in the cardiovascular research field. You study disease mechanisms in the broadest sense, and learn to conduct (cardiovascular) disease-related translational research in cooperation with clinical and pre-clinical staff.

It's thanks to mice — and the usefulness as a model to help find treatments for various diseases — that we know a fair amount about the underlying biology of coronaviruses today. Since 1949, when murine coronavirus (also called mouse hepatitis virus) was first isolated, scientists have studied it in the lab, particularly some of its ...

The Cell Biology of Disease Graduate Program trains students in understanding and developing treatments for human disease. The program is multidisciplinary in nature, drawing on faculty expertise in all aspects of disease biology including defining the molecular mechanisms underlying pathology, developing model systems, 'omic' sciences (genomics, transcriptomics, proteomics, lipidomics, metabolomics, and microbiomics) and designing therapeutic interventions using regenerative biology ...

Coronaviruses are a large family of viruses that usually cause mild to moderate upper-respiratory tract illnesses, like the common cold. However, three new coronaviruses have emerged from animal reservoirs over the past two decades to cause serious and widespread illness and death. There are hundreds of coronaviruses, most of which circulate among such animals as pigs, camels, bats and cats.
