When a parent should worry that their daughter may be is late, because she's never had a period before would be at age 16. If she's already shown signs of breast development. If she has no breast development whatsoever and she's 14, that's too late. So at that point either 16 with signs of breast development or 14 with no signs of breast development she should then bring her daughter in for a medical evaluation to get a hormonal work up and may be some other tests on to find out why she has ...

When Is Considered Late for Onset of Menses?

The diagnostic delay in the adolescent/adult-onset form is likely greater, but the full extent of that delay cannot be determined because of a limited number of reported cases.
