In petroleum exploration and development, formation evaluation is used to determine the ability of a borehole to produce petroleum. Essentially, it is the process of "recognizing a commercial well when you drill one".

### **Formation evaluation - Wikipedia**

The primary objective of formation evaluation is to determine the size of a reservoir, the quantity of hydrocarbons in place, and the reservoir's producing capabilities. The initial discovery of a reservoir lies squarely in the hands of the exploration geologist using seismic, gravity and magnetics studies, and other geologic tools.

**EVALUATION 1.1** Introduction. The search for economic accumulations of oil and gas starts with the recognition of likely geological provinces, progresses to seismic surveying, and the drilling of one or more wild-cat wells. If one is lucky, these wells may encounter oil, and if that is the case, measurements made down the hole with wireline tools are used to assess whether sufficient oil is present, and whether it can be produced.

A conductivity formulation permits the asking of questions about how a formation's conductivity should respond to changes not only in brine conductivity, but also in the fractional amount of brine in a formation, and its geometrical configuration. By answering these questions in an obvious way, and with some analysis of data taken in the laboratory, an intuitively obvious model explaining bulk formation conductivity emerges.
