Soil Engineering Solved Problems

Solved Problems in Soil Mechanics. For area "2" (Triangle $\rightarrow B_1=0.0$, $B_2=$) The triangle that added to area "1" to be a trapezoidal area must be subtract, because it is not from the total embankment area. $q(2)=\gamma \times H$, $B_1.Z=0.0$, $B_2.Z=$ $\rightarrow I_2(2)=$ (From .) $\Delta\sigma(2)=q(2) \times I_2(2)=$.
So, $\Delta\sigma(D)=\Delta\sigma(1)-\Delta\sigma(2)=$.

As per Karsten et al. [11], the shear strength of soils is of special relevance among geotechnical soil properties because it is one of the essential parameters for analyzing and solving stability problems (calculating earth pressure, the bearing capacity of footings and foundations, slope stability or stability of embankments and earth dams). Considering these, interactions among different geotechnical properties and their influences on civil engineering structures have been discussed in ...
